## 13 Regulatory Background

### 14 *Federal and State Regulations*

15 The overarching federal law concerning water quality is the Clean Water Act, passed in 1972,  
 16 and applicable to surface waters and wetlands. In contrast, the federal Safe Drinking Water Act  
 17 (SDWA) applies to both surface and groundwater, providing protection to drinking water supplies.  
 18 Under the SDWA, federal standards were established through the United States Environmental  
 19 Protection Agency (USEPA), in the form of maximum concentration levels (MCLs). Secondary  
 20 maximum contaminant levels (SMCLs) have also been established at the federal level; these ad-  
 21 dress aesthetics of drinking water sources and are not enforceable. The state of California has its  
 22 own Safe Drinking Water Act that includes MCLs and SMCLs which are, for select constituents,  
 23 stricter than those set at the federal level. The California MCLs and SMCLs are codified in Title  
 24 22 of the California Code of Regulations (CCR). The standards established under the federal and  
 25 state Safe Drinking Water Acts are enforced through the State Water Resource Control Board's  
 26 (SWRCB's) Division of Drinking Water (DDW).

27 The California Porter-Cologne Water Quality Act, contained in California Water Code Division 7,  
 28 applies to groundwater and surface waters, designating responsibility for water quality and safe  
 29 drinking water to the SWRCB and the nine Regional Water Quality Control Boards (RWQCB) in  
 30 California. The Act requires RWQCBs to develop water quality control plans for the region with  
 31 defined water quality objectives. These water quality objectives, defined for specific hydrologic  
 32 regions, protect the quality of surface waters, groundwaters, and associated beneficial uses. The  
 33 water quality control plan must be approved by both the SWRCB and the USEPA. The Shasta  
 34 Valley Basin is in the North Coast Region and is regulated under the North Coast Regional Water  
 35 Quality Control Board (Regional Water Board), with water quality objectives detailed in the Water  
 36 Quality Control Plan for the North Coast Region (Basin Plan).<sup>1</sup>

37 The SWRCB's Policy for Water Quality Control For Recycled Water (Recycled Water Policy),<sup>2</sup> most  
 38 recently amended in 2018, includes additional requirements to address salt and nutrients. Under  
 39 this policy, Regional Water Boards are required to assess basins or subbasins within the region  
 40 where water quality is threatened by salt and nutrients, and where management is required. In  
 41 basins or subbasins where salt and nutrients are identified as a threat, a salt and nutrient man-  
 42 agement plan (SNMP) or equivalent management plan is required; this plan can address other  
 43 constituents in addition to salt and nutrients.

### 44 *Water Quality Control Plan for the North Coast Region*

45 The Water Quality Control Plan for the North Coast Region (Basin Plan) is a regulatory tool used  
 46 by the North Coast Regional Water Quality Control Board (Regional Water Board) to protect water  
 47 quality within the North Coast Region. The Basin Plan is adopted by the NCRWQCB and ap-  
 48 proved by the State Water Resources Control Board; the water quality standards are approved  
 49 by the United States Environmental Protection Agency (USEPA). Within the Basin Plan, beneficial  
 50 uses of water, water quality objectives, including an antidegradation policy and plans for imple-  
 51 menting protections are included. Table 2-1 of the Basin Plan designates all groundwaters with the  
 52 beneficial uses of (California North Coast Regional Water Quality Control Board 2018):

<sup>1</sup>{North Coast Regional Water Quality Control Board. 2018. "Water Quality Control Plan for the North Coast Re-  
 gion". Available: [https://www.waterboards.ca.gov/northcoast/water\\_issues/programs/basin\\_plan/](https://www.waterboards.ca.gov/northcoast/water_issues/programs/basin_plan/)}

<sup>2</sup>{SWRCB Resolution No. 2018-0057 and "Amendment to the Policy for Water Quality Control For Recycled Wa-  
 ter". Available: [https://www.waterboards.ca.gov/board\\_decisions/adopted\\_orders/resolutions/2018/121118\\_7\\_final\\_](https://www.waterboards.ca.gov/board_decisions/adopted_orders/resolutions/2018/121118_7_final_amendment_oal.pdf)  
 amendment\_oal.pdf}

- 53 • Municipal and Domestic Supply (MUN)
- 54 • Agricultural Supply (AGR)
- 55 • Industrial Service Supply (IND)
- 56 • Native American Culture (CUL)

57 Potential beneficial uses include:

- 58 • Industrial Process Supply (PRO)
- 59 • Aquaculture (AQUA)

60 The MUN beneficial use applies to all groundwater in Shasta Valley. For chemical constituents  
61 in waters with MUN beneficial uses, the Basin Plan specifies that no waters are to exceed the  
62 maximum contaminant levels (MCL) in Title 22 of the California Code of Regulations (CCR). The  
63 Basin Plan also includes numeric water quality objectives, specifically for groundwaters in the  
64 Shasta Valley hydrologic area.

65 A complete list of constituents, comparison concentrations and sources are listed in Table 2.

## 66 Water Quality Assessment

### 67 Data Sources

68 Water quality data was obtained from several databases and supplemented with data provided  
69 by local organizations and community members. The majority of the water quality data used in  
70 the assessment was sourced from the SWRCB's Groundwater Ambient Monitoring and Assess-  
71 ment Program (GAMA), a database containing datasets from agencies including the Department  
72 of Pesticide Regulation (DPR), Department of Water Resources (DWR), the State Water Board,  
73 Lawrence Livermore National Laboratory (LLNL) and the United States Geological Survey (USGS).  
74 Additional data in the Shasta Valley Wildlife Area was directly provided by the California Depart-  
75 ment of Fish and Wildlife.

76 The datasets in GAMA with information in Shasta Valley Groundwater Basin are:

- 77 • **The Public Water System Wells** dataset includes wells regulated by the State Water Board's  
78 Division of Drinking Water (DDW). This dataset includes information for active and inactive  
79 drinking water sources with 15 or more connections or more than 25 people per day.
- 80 • **National Water Information System (NWIS)**, a dataset provided by USGS with samples  
81 from water supply wells and reported quarterly to the State Water Board's data management  
82 system, GeoTracker.
- 83 • **Monitoring wells** regulated by the State Water Board includes wells under different regulatory  
84 programs, with data available for download through GeoTracker. There are monitoring wells  
85 in Shasta Valley Basin for the following programs:
  - 86 – Leaking Underground Storage Tank (LUST) Cleanup sites
  - 87 – Cleanup Program Sites

88 – Land Disposal Sites

- 89 • **GAMA’s Priority Basin Project**, a State Water Board, USGS and LLNL initiative to assess  
 90 groundwater quality statewide. Data primarily collected from public water system wells but  
 91 private domestic, monitoring and irrigation wells are also sampled.
- 92 • **DWR’s Water Data Library**, a dataset including groundwater quality and depth data with  
 93 samples from multiple well types including irrigation, stock, domestic and public supply.
- 94 • **Department of Pesticide Regulation’s Groundwater Protection program**, a compilation  
 95 of information from DPR and other public agencies from domestic, public supply and irrigation  
 96 wells.

97 **Selection of Numeric Thresholds**

98 Numeric thresholds are used with well data to evaluate groundwater quality. These numeric stan-  
 99 dards are selected to satisfy all relevant groundwater quality standards and objectives; the general  
 100 selection approach used is consistent with recommendations by the State Water Board for de-  
 101 termination of assessment thresholds for groundwater [Reference]. More than one water quality  
 102 objective or standard may apply to a constituent and a prioritization process is used to select the  
 103 numeric threshold value. Where available, the strictest value, of the federal and state regulated  
 104 water quality standards, and water quality objectives specified in the Basin Plan, is used.

105 The following sources were used in establishing the numeric thresholds:

106 i) Basin Plan numeric water quality objectives

107 Specific groundwater quality objectives are defined in the Basin Plan for specific conduc-  
 108 tance, pH, hardness and boron. These limits are listed in Table 1 below.

Table 1: Basin Plan Specific Water Quality Objectives for Groundwaters in the Shasta Valley Hydrologic Area

Constituent	Limit Type	Value
Specific Conductance (mmhos) at 77 degrees F	90% Upper Limit	800
Specific Conductance (mmhos) at 77 degrees F	50% Upper Limit	500
pH	Maximum	8.5
pH	Minimum	7
Boron (mg/L)	90% Upper Limit	1
Boron (mg/L)	50% Upper Limit	0.3
Hardness (mg/L)	50% Upper Limit	180

109 ii) State and Federal Maximum Contaminant Levels (MCLs)

110 MCL-CA: State of California MCLs

111 MCL-US: Federal MCLs

112 Per the Basin Plan, groundwaters in the Shasta Valley hydrologic area have a designated  
113 beneficial use as domestic or municipal water supply (MUN) beneficial use and must not  
114 exceed the maximum contaminant levels (MCLs) and secondary maximum contaminant  
115 levels (SMCLs) defined in Title 22 of the California Code of Regulations (CCR). The  
116 strictest value of the state and federal MCLs and SMCLs is used.

117 The complete list of constituents and corresponding sources and values for comparison concen-  
118 trations used in the water quality analysis can be found in Table 2.

Table 2: Comparison concentrations and data sources for constituents used in the water quality assessment.

## 119 Calculations

120 Specific water quality objectives for the Shasta Valley hydrologic area groundwaters, as defined  
121 in the Basin Plan have specific limits and calculation requirements associated with specific con-  
122 ductance, hardness and boron. Per the Basin Plan, the 50% upper limit and 90% upper limit are  
123 defined as follows:

- 124 • 50% upper limits represent “the 50 percentile values of the monthly means for a  
125 calendar year. 50% or more of the monthly means must be less than or equal to an  
126 upper limit and greater”
- 127 • 90% upper limits represent “the 90 percentile values for a calendar year. 90% or  
128 more of the values must be equal to an upper limit and greater than or equal to a  
129 lower limit”.

130 Measurements of specific conductance and boron were organized to enable comparison to the  
131 50% and 90% limits through calculation of monthly means for comparison to the 50% upper limits  
132 and organization by calendar year for comparison to the 50% and 90% upper limits.

## 133 Filtering Process

134 To analyze groundwater quality, several filters were applied for relevance and quality. Though  
135 groundwater quality data for the Basin is available from the 1950s, data was limited to only include  
136 information collected in the past 30 years. Restricting the timespan from which data was collected  
137 increases confidence in data collection methods and quality of the data and focuses on information  
138 that is reflective of current groundwater quality conditions.

139 Groundwater quality was analyzed through comparison, for each constituent, of well data to the  
140 corresponding comparison concentration. Maps were generated for each constituent showing well  
141 locations and number of samples and categorizing and displaying data into the following groups:

- 142 a) Not detected
- 143 b) Detected but below half of the comparison concentration
- 144 c) Detected and above half of the comparison concentration
- 145 d) Above the comparison concentration

146 Two iterations of map generation was conducted with the following scenarios:

- 147 1. Data is limited to those collected in the past 30 years only (1990-2020)
- 148 2. Data is limited to wells that have more than one data point in the past 30 years (1990-2020)

149 For the second scenario, where data is limited to wells that have more than one data point in the  
150 past 30 years, timeseries are generated for each constituent and well to identify changes over time  
151 in groundwater quality at a location.

152 The following sections contain the maps produced from these analyses.

## 153 Results

### 154 Constituents of Concern (COCs)

155 Constituents of Concern (COCs) were identified based on visual identification of potential ground-  
156 water quality issues using the maps generated in this assessment, identification of common con-  
157 stituents of concern, and through discussion with stakeholders. Resulting from this analysis and  
158 discussion with stakeholders, the full list of constituents of concern (COCs) were:

- 159 1. Arsenic
- 160 2. Boron
- 161 3. Benzene
- 162 4. Iron
- 163 5. Manganese
- 164 6. Nitrate as N
- 165 7. pH
- 166 8. Specific Conductivity

167 *[This section should include further detail on decision making process, constituents included*  
168 *i.e. clean up sites under purview of another agency once the list is finalized]*

169 A series of maps for each COC, with water quality data from the past 30 years (1990-2020), show  
170 the location of tested wells and whether the maximum concentration ever recorded in that well has  
171 exceeded the MCL. In Shasta Valley, the water quality source database categorized some wells as  
172 either municipal or monitoring. Municipal wells are a public supply well, typically related to a city  
173 or town. Monitoring wells are used for monitoring groundwater, such as for site cleanup programs  
174 or Irrigated Lands Regulatory Program. The following timeseries graphs organize wells by the  
175 highest maximum concentration to the lowest.

176 Figure 1 shows all wells that have been tested for Total Arsenic, even if only one monitoring event  
177 has occurred. Figure 2 filters the wells for those with two or more monitoring events. In the past 30  
178 years, two wells near Edgewood and one near Grenada have high concentrations. Timeseries of  
179 wells in Figure 2 show that wells with high arsenic have not been sampled since 2012 (Figure 3 to  
180 Figure 7). The municipal well east of Grenada has elevated but declining arsenic. The remaining  
181 wells have low arsenic or non-detect.

182 The majority of boron water quality data in Shasta Valley is only the dissolved fraction while water  
183 quality regulations refer to the total fraction. Total boron can be greater or equal to dissolved boron.  
184 Therefore the following boron graphs are conservative. Figure 8 shows a number of high dissolved  
185 boron wells, though many of these wells have only one monitoring event and a trend analysis  
186 cannot be completed. Figure 9 has seventeen boron wells available for trend analysis. The three  
187 wells with high boron have not been sampled since 2011 and two have decreasing concentrations  
188 (Figure 10 to Figure 12). The remaining wells have low boron.

189 High benzene in Shasta Valley is associated with cleanup sites near Yreka and Carrick (Figure 13  
190 and Figure 14). Trend analysis show that benzene concentrations have remained steady or are  
191 decreasing over time (Figure 15 to Figure 18).

192 High iron is detected in the east side of the valley, east of Grenada and Gazelle (Figure 19) but  
193 trend analysis can only be completed for wells in Figure 20. Trend analysis shows low iron for all  
194 wells since 1991 (Figure 21 to Figure 24).

195 High manganese occurs in selected wells through most of Shasta Valley (Figure 25 but trend  
196 analysis can only be completed for wells in Figure 26. Similar to iron, trend analysis shows low  
197 manganese for all wells since 1991 (Figure 27 to Figure 30).

198 High nitrate only occurs in a few wells in Montague and Grenada (Figure 31 and Figure 32). In  
199 wells with elevated nitrate, trend analysis show that nitrate has been generally decreasing or steady  
200 through time (Figure 33). Well 45N06W27D002M in Montague has high nitrate but was only sam-  
201 pled twice. Wells with low nitrate have generally maintained steady levels (Figure 34 and Fig-  
202 ure 37).

203 Shasta Valley has limited pH data, with most data outside the limits set by the Basin Plan (Figure 38  
204 and Figure 39). Trend analysis of two wells show pH that is slightly more basic then the Basin Plan  
205 limits (Figure 40).

206 Specific conductivity is elevated in the middle of Shasta Valley (Figure 41 but trend analysis can  
207 only be completed for wells in Figure 42). Trend analysis show that wells with high specific con-  
208 ductivity have not been sampled since 2011 (Figure 43 and Figure 46).
